

Web figure 2: Early removal of telehealth for reasons other than death across the 12 month trial period. Note: Data are based on all participants in the nested WSD Telehealth Questionnaire Study who received telehealth at baseline (including usual care participants who received telehealth in error) (n=856). Crude estimates of early removal of telehealth for reasons other than death are based on data provided by the local WSD project teams. ‘Removal’ refers to the complete uninstallation of all telehealth devices (base unit / set-top box plus all peripheral devices).
